The average CCI score was 3.78, indicating an estimated 10-year survival of 53%. Obesity is an outstanding common factor. The three patient deaths do not have significant medical comorbidities, including obesity, COPD, chronic kidney disease, and ASA should receive a "second look" before approval for AS.

Further research into the TMC transfer process could help shorten transfer time.

- This project incorporates two SELECT domains, health systems and VBPCC, to improve patient safety and satisfaction.
- Obesity is the most outstanding common factor between cases.
- The TMC transfer process should undergo further investigation.
- Risk calculators may prove useful.
- This project demonstrates that the TMC health system selects appropriate candidates for AS.
