# Impact of Atrial Fibrillation on Outcomes in Patients Hospitalized with ST-Segment Elevation Myocardial Infarction

Lohit Garg, Sahil Agrawal, Manyoo Agarwal, Aakash Garg, Amitoj Singh, Nirmanmoh Bhatia, Mahek Shah, Brijesh Patel, Sudip Nanda, David Cox Lehigh Valley Health Network, Allentown, Pennsylvania

- Atrial fibrillation (AF) is the most common persistent cardiac arrhythmia with an increasing incidence in the United States (US)
- AF is present in 12-15% patients presenting with STEMI
- Previous reports have suggested that STEMI patients who have AF have worse outcomes.

## OBJECTIVE

 We sought to determine the impact of AF on in-hospital outcomes of patients admitted with STEMI in the United States

## METHODS

- Data were obtained from the Nationwide Inpatient Sample database for years 2003- 2013
- ICD 9 codes were used to identify patients with STEMI and AF
- Baseline demographic and clinical features were studied and compared between groups of patients with and without AF.
- The primary outcome of interest was all-cause in-hospital mortality.
- Utilization of percutaneous coronary intervention (PCI) and coronary artery surgery (CABG), and the incidences of complications (periprocedural hemorrhage, gastrointestinal bleeding, blood transfusion, and acute ischemic stroke) were also compared in the 2 groups.
- Results are expressed as frequencies (%) for categorical variables and mean ± SD for continuous variables.
- Differences between groups were analyzed using the Student's t test for continuous variables and the chi-square test for categorical variables.
- Statistical analyses were performed using IBM SPSS, Statistics, version 20.0 (IBM Corp., Armonk, New York).

## RESULTS

- Of the total 2,632,447 STEMI hospitalizations, AF was documented in 339,987 (12.9%) patients
- At baseline, patients with AF were older (mean 74 vs 63 years, p<0.001) and more likely to be female (42% vs 34%, p<0.001) or white (85% vs78%; p<0.001). (Table 1)</li>
- Hypertension, chronic renal failure, diabetes mellitus and congestive heart failure were all more prevalent among those with AF (p<0.001 for all). (Table 1)
- AF patients were less likely to undergo coronary angiography or any coronary revascularization than non-AF patients. They were more likely to undergo CABG but less likely to undergo PCI.
- Patients with AF had higher risk adjusted in- hospital mortality (16.3% vs 7.9%; OR: 1.16; Cl: 1.15-1.18; p<0.001). and an increased risk of bleeding complications after both PCI (12.2% vs 5.3%; OR: 1.18; Cl: 1.16-1.21; p<0.001) and CABG (40.0% VS 33.5%; OR: 1.11; Cl: 1.08-1.13; p<0.001). (Table 2)</li>
- Average length of stay was also longer among those with AF (mean of 7 days vs 4 days; p<0.001).</li>

| Table 1. Baseline Characteristics   |                     |                     |  |  |  |
|-------------------------------------|---------------------|---------------------|--|--|--|
| Characteristics                     | AF (339,988)        | Non-AF (2,292,259)  |  |  |  |
| Age                                 | 74.4 +/- 12.5 years | 63.6 +/- 14.3 years |  |  |  |
| Male                                | 196,455 (57.8%)     | 1,506,360 (65.7%)   |  |  |  |
| White                               | 228,017 (85.3%)     | 1,391,804 (77.9%)   |  |  |  |
| African American                    | 12,680 (4.7%)       | 146,865 (8.2%)      |  |  |  |
| Insurance - Medicare                | 247,890 (73%)       | 102,4303 (44.8%)    |  |  |  |
| Insurance - Medicaid                | 10,715 (3.2%)       | 143,467 (6.3%)      |  |  |  |
| Private                             | 63,246 (18.6%)      | 837,280 (36.6%)     |  |  |  |
| Obesity                             | 25,089 (7.4%)       | 222,451 (9.8%)      |  |  |  |
| Hypertension                        | 199,029 (59.1%)     | 1,312,941 (57.7%)   |  |  |  |
| Diabetes Mellitus                   | 93,338 (27.7%)      | 613,886 (27%)       |  |  |  |
| Dyslipidemia                        | 131,068 (38.6%)     | 1,162,491 (50.7%)   |  |  |  |
| Current or Former Smoker            | 71,638 (21.1%)      | 874,986 (38.2%)     |  |  |  |
| Prior Myocardial Infarction         | 25,685 (7.6%)       | 167,260 (7.3%)      |  |  |  |
| Prior PCI                           | 25,216 (7.4%)       | 206,090 (9%)        |  |  |  |
| Prior CABG                          | 17,697 (5.2%)       | 91,920 (4%)         |  |  |  |
| Chronic Kidney Disease              | 51,047 (15.2%)      | 177,995 (7.8%)      |  |  |  |
| Chronic Lung Disease                | 73,306 (21.8%)      | 355,026 (15.6%)     |  |  |  |
| History of Cerebrovascular Accident | 10,529 (3.1%)       | 39,254 (1.7%)       |  |  |  |
| Peripheral Vascular Disease         | 32,878 (9.8%)       | 160,974 (7.1%)      |  |  |  |

| Table 2. Outcomes                  |        |        |                     |         |  |
|------------------------------------|--------|--------|---------------------|---------|--|
| Treatment and Outcomes             | AF     | Non-AF | Adjusted Odds Ratio | P-value |  |
| Coronary Angiograophy              | 58.2 % | 72.7 % | 1.00 (0.98-1.01)    | .50     |  |
| Percutaneous Coronary Intervention | 41 %   | 61 %   | 0.92 (0.91-0.93)    | <0.001  |  |
| Coronary Artery Bypass Grafting    | 15%    | 7%     | 2.37 (2.34-2.40)    | <0.001  |  |
| All-cause In-hospital Mortality    | 16.3%  | 7.9 %  | 1.16 (1.15-1.18)    | <0.001  |  |
| Cardiogenic Shock                  | 14.2%  | 7.6%   | 1.27 (1.25-1.28)    | <0.001  |  |
| Bleeding Complications (PCI)*      | 12.2%  | 5.3%   | 1.18 (1.16-1.21)    | <0.001  |  |
| Bleeding Complications (CABG)      | 40.0%  | 33.5%  | 1.11 (1.08-1.13)    | <0.001  |  |
| Acute Ischemic Stroke              | 1.7%   | 0.8%   | 1.4 (1.35-1.44)     | <0.001  |  |

\* GI bleed, retroperitoneal hematoma, transfusion or acute anemia.

## LIMITATIONS

- Retrospective design of the study and possibility of varying coding practices among hospitals.
- Inability to differentiate paroxysmal from persistent or permanent AF.
- Medication related data are unavailable due to administrative nature of the database

### CONCLUSIONS

- AF is common among patients presenting with STEMI.
- AF is associated with older age, and higher prevalence of comorbidities at admission in STEMI patients.
- AF is independently associated with higher in-hospital mortality, and periprocedural complications in STEMI patients.
