Small bowel metastasis from head and neck are very rare. Autopsy studies showed that the most common sites of metastases in head and neck carcinoma are lungs (72%), liver (38.6%), kidney, and adrenal (21% each), bone (23%). Two rather rare sites are heart (12%) and small intestine (7%). We present an unusual case of obstructive jaundice secondary to metastatic tonsillar cancer to the duodenum that was successfully treated by endscoping stenting.

A 60 year old male with a remote history of tonsillar squamous cell cancer (SCC) treated with chemoradiation presents with a three day history of abdominal pain. Three months prior to this presentation he was found to have metastatic SCC in the jejunum which was treated with curative resection. He admitted weight loss of 14 pounds in last 3 weeks due to anorexia. Abdominal exam was very tender to palpitation in epigastric region, but normal bowel sounds. On initial laboratory assessment, he had multiple abnormalities in his liver function panel including AST - 160 U/L, ALT - 218 U/L, Alkaline phosphatase – 281 U/L, Lipase - 10304 U/L, Total Bilirubin - 3.0 mg/dl. CT abdomen with contrast showed gallbladder distention and mild prominence of the intra-and extra hepatic bile duct. MRI abdomen showed double duct sign. He underwent endoscopic retrograde cholangiopancreatography (ERCP) with biliary stent and drain placement. His abdominal pain improved significantly and was discharged in a stable condition. Pathology of the biopsied mass was consistent with metastatic squamous cell carcinoma of tonsil.

The most common presentation of head of neck metastasizing to small bowel is gastrointestinal bleeding, perforation, gastric outlet obstructive symptoms but rarely they develop obstructive jaundice. This patient had a history of tonsillar SCC with metastasis to jejunum so suspicion was very high for SCC metastasis. Only twelve cases of small bowel metastasis from head and neck have been reported. The majority of them originate from laryngeal SCC and only one case reported tonsillar cancer metastasizing to ileum. Our case is the first one to illustrate tonsillar cancer with metastasis to the duodenum causing obstructive jaundice. Diagnosis is made through endoscopic biopsy.
