Sepsis is the leading cause of death in hospitalized patients, with estimated mortality between 25-50 percent. Evidence shows that reducing mortality due to severe sepsis requires an organized process that guarantees the early recognition of severe sepsis, along with standard and consistent application of sepsis resuscitation algorithms. A seminal study in an acute, tertiary teaching facility focused initially on sepsis recognition and treatment in emergency departments (EDs), reducing overall sepsis mortality by approximately 50 percent in a six-year period (2008-2013).
